Electricity is an integral part of our daily lives, often unnoticed until it is unavailable. Recent widespread electrical outages in the United States have led to the implementation of stringent electrical grid reliability regulations and standards.

Several organizations are involved in ensuring the future reliability, stability, and security of the electric grid, including the Federal Energy Regulatory Commission (FERC) with its Office of Electric Reliability, the North American Electric Reliability Corporation (NERC), and various Regional Entities.

Join us for a complimentary, one-day open house seminar. This event aims to provide valuable insights into navigating the NERC landscape. The seminar will cover the following topics:

- “NERC Speak”: Common abbreviations and definitions related to electric reliability guidelines and standards.
- NERC Standards: When NERC standards apply to a facility or organization and what these standards and requirements entail.
- “NERC Jail”: Potential penalties or consequences for non-compliance with NERC standards or failing an audit, including common examples of NERC non-compliance.

Join us to enhance your understanding of NERC regulations and ensure your operations remain compliant and secure.
